#### **NB Healthcare Technologies Pvt Ltd**

# Day 9 Morning Assignment (3 – Feb- 2022) By Vamsi Krishna Mandapati

- 1. Write a C# program to read input from user and print
  - a. factorial of a number
  - b. factors of a number
  - c. check if it prime or not

Code:

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
namespace Day9Project1
    class MathsOperations
        private int input;
        public void ReadInput()
            Console.WriteLine("Enter Number:");
            input = Convert.ToInt32(Console.ReadLine());
        public void Factorial()
            int fact = 1;
            for(int i =1; i <= input; i++)</pre>
                fact = fact * i;
            Console.WriteLine(fact);
        public void PrintFactors()
```

```
{
            for(int i = 1; i <= input; i++)</pre>
                 if(input % i == 0)
                     Console.WriteLine(i);
                 }
             }
        }
        public bool isPrime()
             int count = 0;
            for(int i = 1; i <=input; i++)</pre>
                 if(input % i == 0)
                     count++;
             if(count == 2)
                 return true;
             else
                 return false;
        }
    }
    internal class Program
        static void Main(string[] args)
            MathsOperations obj = new MathsOperations();
             obj.ReadInput();
             obj.Factorial();
             obj.PrintFactors();
             if (obj.isPrime())
                 Console.WriteLine("input is prime numner");
             else
                 Console.WriteLine("input is not a prime
number");
            Console.ReadLine();
```

```
Output:

D:\NB HealthCare Training\DotNet Projects\Day 9 Morning Assignments\Day9Project1\Day9Project1\bin\Debug\Day9Project1.exe

Enter Number:
5
120
1
5
input is prime numner
—
```

```
2. Write C# program to read two numbers from use and print
 a. sum of two numbers
 b. difference of two numbers
 c. product of two numbers
 d. division of two numbers.
Code:
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
namespace Day9Project2
    class MathTask
    {
         public int a;
         public int b;
         public void ReadInput()
             Console.WriteLine("Enter first number");
             a = Convert.ToInt32(Console.ReadLine());
             Console.WriteLine("Enter second number");
             b = Convert.ToInt32(Console.ReadLine());
```

```
}
        public int AddNumbers()
            return a + b;
        public int SubstractNumbers()
            return a - b;
        public int MultiplyNumbers()
            return a * b;
        public float DivideNumbers()
            return a / b;
    internal class Program
        static void Main(string[] args)
            MathTask mt = new MathTask();
            mt.ReadInput();
            Console.WriteLine(mt.AddNumbers());
            Console.WriteLine(mt.SubstractNumbers());
            Console.WriteLine(mt.MultiplyNumbers());
            Console.WriteLine(mt.DivideNumbers());
            Console.ReadLine();
        }
    }
Output:
```

3. Create an employee class with below variables id, name, salary, company write methods to read data and print data.

```
Code:
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
namespace Day9Project3
    class Employee
        public int id;
        public string name;
        public int salary;
        public static string company = "NationsBenefits";
        public Employee(int eid, string ename, int esalary)
            id = eid;
            name = ename;
            salary = esalary;
        public void PrintData()
            Console.WriteLine($"id = {id}, name = {name},
salary = {salary}, company = {company}");
    internal class Program
```

```
{
    static void Main(string[] args)
    {
        Employee emp = new Employee(01, "Vamsi", 9000);
        emp.PrintData();
        Console.ReadLine();
    }
}
Output:

Double Limit Double Limit Lim
```

### 4. Research and find the difference between normal variable and static variable.

Normal variable	Static variable
1. Normal Variable is different for	1. Static Variable is same for all
different objects	objects
2.No Keyword is required for	2. static keyword is required for
defining/initialising the normal	defining/initialising the static
variable.	variable.
3. Normal variables stores in each	3. Static variable stores in class at
objects, so it consume more memory.	once , so it saves memory.
4. If a variable is declared inside the	4. If a variable is declared inside the
class and outside the methods and	class, outside the methods and

variable.

outside the constructors without outside the constructors with static static keyword, then it is called as variable or instance non static variable.

The memory for the instance variable will be allocated multiple times i.e. one time for every object that is created. If we do not want to allocate the memory for a variable multiple times, then declare the variable with static keyword.

## **Syntax for static variable:**

static datatype variableName;

• The memory for the static variable will be allocated during the class loading time.

keyword, then it is called as static

- The memory for static variable will be allocated in method area.
- The memory for static variable will be allocated one time for entire class.
- All the objects will share the same copy of the static variable.
- static keyword can be applied to both variables and methods.
- If a static variable is declared and not initialized, then it will be initialized automatically with

default value. If we don't want static variable to contain default value, then we can initialize the static variable with our own value at the time of declaration.

- 5. The instance members(instance variables and instance methods) can be accessed only by using reference(object). class can The contain both instance members(instance variables, instance methods) and static members(static variables, static methods).
- 5. static members(static variables and static methods) can be accessed either by using a class name or by using a reference(object). It is recommended to access the static members by using class name, because we cannot guarantee the existence of the object.

#### 5. Write 5 points discussed about constructor

- 1.A constructor is used to initialize class variables while creating an object.
- 2.By Default, C# will have default constructor which initialize to default values.(even if we didn't see it, which will initialize to default values). Employee emp = new Employee();
- 3. The moment when we write our own constructor, default constructor will be gone. (still if we need default constructor we can create default constructor again exclusively, with default values).
- 4.A Constructor name should be same as that class name.
- 5. We can create any no. of constructors for a class.
- 6. if constructor variable names are same as class variable names then we have to use this(this.) keyword at(before) class variables.

6. Create Employee class with two constructors as discussed in the class.

```
Code:
```

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Text;
using System.Threading.Tasks;
namespace Day9Project4
    class Employee
        public int id;
        public string name;
        public int salary;
        public static string company = "NationsBenefits";
        public Employee()
            this.id = 0;
            this.name = null;
            this.salary = 0;
        }
        public Employee(int eid, string ename, int esalary)
            this.id = eid;
            this.name = ename;
            this.salary = esalary;
        }
        public void PrintData()
            Console.WriteLine($"id = {id}, name = {name},
salary = {salary}, company = {company}");
```

```
}
     internal class Program
          static void Main(string[] args)
               Employee emp1 = new Employee(01, "Vamsi", 9000);
               emp1.PrintData();
               Employee emp2 = new Employee();
               emp2.PrintData();
               Console.ReadLine();
          }
     }
Output:
D\NB HealthCare Training\DotNet Projects\Day 9 Morning Assignments\Day9Project4\Day9Project4\bin\Debug\Day9Project4.exe
id = 1, name = Vamsi, salary = 9000, company = NationsBenefits
id = 0, name = , salary = 0, company = NationsBenefits
```
